

Lab: Finalize Your Use Case

Estimated Time: 25 min

Objectives

- Develop metrics that align to your business goal
- Formulate at least one plausible genAI integration use case

Prerequisites

You should have familiarity with:

- GenAI prompt writing best practices
- Business areas to consider when making strategic AI changes
- Output from the previous lab indicating information you need to have AI help you identify appropriate metrics

Introduction

In a previous lab, you combined what you know about prompt writing to use AI for brainstorming metrics to measure success related to your business goal.

From the previous lab, you should have a text document containing the following:

- Your pain points
- Your prompt for brainstorming changes to alleviate your pain points
- At least one change you would like to see that may help alleviate these pain points
- Additional context about your business requested by the AI so it can help you identify metrics for your use case

Excercise 1: Develop Metrics

Step 1: Identify

In this step, you will use the genAI tool to help you develop metrics to assess the success of your business goal.

Recall the example from the previous lab:

As a customer service director of a mid-sized online retailer. I have exceeded my allotted customer service budget over the last three quarters.

We identified a change to help address this pain point:

Anticipate and address customer issues before they escalate into costly interactions.

From our example, we asked the AI to identify other information it needs to help it suggest metrics for measuring the success of the business goal.

For our example, we will use the context below:

Customer service metrics

- Average response time is 8 minutes.
- First response resolution rate is approximately 65%
- 25% of cases are escalated

Specific pain points or challenges

- Complex issues related to returns, refunds, and product details consume significant time.
- High volumes during sales events lead to overwhelmed staff and increased response times.
- Limited knowledge-sharing among team members
- Lack of integration between customer service tools and inventory management systems slows responses.

Non-essential tasks

- We have no data on this topic

Customer service tools or software to track metrics

- CRM software tracks customer interactions and generates basic reports.
- Helpdesk Platform manages tickets and inquiries but lacks advanced analytics.
- Manual Logs are used for tracking escalations and common issues.

Current data sources

- Historical interaction data, including inquiry types, resolution times, and outcomes.
- Customer feedback surveys and CSAT ratings.
- Sales and return records for context on product-related issues.

In order to establish metrics with AI assistance, you should have further context provided by the AI that it needs to recommend metrics. At this point you will need to use that context for your own example. If you do not have time to gather that information, use the following example prompt or fabricate responses to the context requirements from the previous lab.

1. On the upper left corner of your lab window, locate the drop-down and select the **GPT-4o** model.
2. View details to see the example prompt. Enter the example prompt in PROMPT INSTRUCTIONS field.
3. Enter your prompt with the appropriate context asking the AI to provide you with 10 plausible metrics to measure the success of your proposed change.

► Example prompt

Note: You can regenerate the response, or if needed, you can select the plus symbol and restart the chat process.

Copy and paste the plausible metrics into your text document.

Step 2: Evaluate output

In this step, you will attempt verify the suggested metrics to decide if all, some, or none of these metrics suit your needs.

Recall you need to check the response validity and evaluate it with respect to your objective:

- *I would like you to identify potential metrics that would measure ways to "better anticipate and address customer issues before they escalate into costly interactions."*

First, establish the validity of its responses. Think critically about these aspects of its proposed metrics to verify the validity of the responses:

- Accuracy
- Consistency
- Reliability
- Free of bias

► Hint: Validating the metrics

Next you need to evaluate the proposed metrics. To evaluate the usefulness of the responses, reflectively consider the response in relation to:

- Alignment with your goals
- Relevancy
- Precision
- Transparency
- Ethical implications

► Hint: Evaluating the metrics

If you cannot fully validate the metrics' validity or confidently evaluate them, you may choose to probe the AI response further. You can include the following prompts:

- *Out of the ten metrics you provided, which ones would you prioritize and why?*
- *If I can only measure three, which would you recommend and why?*
- *Recall that my business case focuses on:*
 - **Anticipating and addressing customer issues before they escalate into costly interactions**

Keeping that in mind along with the context I provided, do you still agree with your response? State the context I gave you regarding my situation first before giving me your answer.

You also need to decide if you have the ability to collect the appropriate measurement data.

Select **at least** two metrics or more from the AI responses or your own to use to measure your business case. Write these metrics in your text document.

Step 3. Write your measurable business goal

A business goal for integrating an AI solution should include:

- Your business goal
- The metric(s) used to determine success
- Minimum value from the metric indicating success

You now have 1) and 2). You will need to use your own context to decide 3).

► Example: Business case with metrics

Write your goal in your text document.

Exercise 2: Formulate Use Cases

In this exercise, you will use your business goal to formulate at least one plausible genAI use case that suits your needs.

Step 1. Identify the business function for your goal

Recall that common genAI applications used in business usually fall within these business functions:

- Strategic decision making
- Operational efficiency
- Customer and user experience
- Creativity and innovation
- Quality control and risk management

In our customer service example we will choose the *operational efficiency* category.

Which **Business Function** listed suits your business goal? Make a note of this business category in your text document.

Step 2. Choose your genAI application

In this step, you will use the table below to identify ways in which genAI is well suited for that business function.

Common genAI Applications in Business

Business Function	GenAI Capacities	Applications in Business
Strategic decision making	Pattern recognition, Data analysis	Actionable insights, Solution identification, Real-time change
Operational efficiency	Process automation, Process efficiency, Repetitive tasks	Workflow automation, Service bots, Improve collaboration, Improve collaboration
Customer and user experience	Natural language processing (NLP), Speech-to-text, Text-to-speech	Personalized content, Real-time responses, Translation
Creativity and innovation	Brainstorming, Idea generation	Marketing, Product design, Training, Less required tech expertise, AR/VR experiences
Quality control and risk management	Visual recognition, Analysis	Defect detection, Audit simplification, Simulations, Process optimization

Note: The application list is not comprehensive. You may choose to investigate other.

In our customer service example business goal, *anticipate and address customer issues before they escalate into costly interactions*, we decide the business function that addressed our pain point fell under the *operational efficiency* category.

Looking at the genAI capabilities that align with our *operational efficiency* business function, we see these applications listed:

- Process automation
- Process efficiency
- Repetitive tasks

All of these capabilities seem well suited to our customer service business goal developed in Exercise 1. Looking in the application column, we see two of the four applications seem to fit the business goal in our example:

- Workflow automation
- Service bots

Now consider your business objective and its business function. Do you see any of the genAI capacities and applications that might work well to address your intended change?

Which capacities suit your business goal from Exercise 1? Write the capacities in your text document.

Step 3. Write a plausible use case

In our example, our plausible use case reads something like:

Use service bots to anticipate and address customer issues before they escalate into costly interactions.

We will measure our success using three metrics:

- *Escalation rates* because this metric directly relates to the outcome we're trying to avoid, costly escalations.
- *Ticket volumes by issue type* because we can use this metric identify recurring themes and implement proactive measures
- *Repeat contact rates* because repeat contacts metrics can indicate unresolved problems, which are early warning signs for potential escalations.

Write your feasible use case in your text document.

Congratulations

You have successfully written a possible use case suited to your business area.

After completing this lab, you now know:

- How to verify AI responses
- How to write potential AI integration use cases

Next Steps

If you wanted to further investigate your use case, you need to conduct a usability study. The next part of the lab walks you through establishing the feasibility of your use case.

We suggest you read through the feasibility study elements, though this part of the lab is optional.

Author

Bethany Hudnutt

For Further Exploration

Optional: Feasibility study

Now that you have one or more plausible genAI use cases suited to your business goal, you will want to think about the viability of implementing those applications by conducting a feasibility study.

- You do not need to complete the feasibility study for this lab. If you were to investigate your use case further, you would conduct this study as the next step.

Recall the categories and related factors you should consider investigating when determining the feasibility of your use case. We have provided this information in the *Use Case Feasibility Factors* table below.

We have also included a second reference table, *Risk Factors and Possible Mitigations* after the *Use Case Feasibility Factors*. When conducting your feasibility study, you should also consider the risks and how to mitigate them in your study.

Use Case Feasibility Factors

Use case consideration categories	Individual factors
Financial ramifications	Revenue growth, Productivity gains , Risk reduction
Operational feasibility	Data, Combining systems, Adaption capabilitiesExpertise
Risk management	Security, Privacy, Dependencies, Compliance, Ethical concerns
User impact	User and customer impact, Transitional effects, Training requirements
Scalability	Financial ramifications, Operational feasibility, Risk management, User impact

Note: This list contains common factors to consider across all industries and is not exhaustive. You will likely find other considerations specific to your scenario.

Risk Factors and Possible Mitigations

Risk factors	Possible causes	Mitigation
Unreliable output	Inappropriate training data	Choose data with these qualities: Representative, Relevant, Reliably sourced, Sufficient amount, Reliable quality, Anticipate complexities

Unreliable output	Outdated model , Outdated data	Monitor model and data regularly and update when needed
Data breaches	Insufficient security measures, Poorly developed policies, Poorly implemented policies	Encryption, Role-based permissions, Security audits, Vet third-parties, Anticipate complexities
Legal complications, Poor reputation	Insufficient policies, Poorly developed policies, Poorly implemented policies, Regulation non-compliance	Staying up-to-date with regulations, Ethics board, Reflection, Anticipate complexities
Failure cascades	Interdependencies	Trust, Transparency, Anticipate complexities, Governance
