

Final Project: Expanding Market Reach for AI Products

Estimated duration: 60 minutes

Introduction

In the previous lab, you analyzed a Product Concept Document proposing the development of an AI-driven system that will monitor and improve traffic flow in a large city and provide a return on investment (ROI). As part of that lab, you performed the following tasks:

- Reviewed the Product Concept Document
- Defined how AI can support the product concept
- Listed how this product could be potentially commercialized
- Developed a product vision

You will continue your analysis of the Product Concept Document in this final lab.

Objectives:

In this lab, you will perform the following tasks:

- List the key AI skills required by the AI product manager and justify your choices.
- Identify challenges and risks you may confront as you plan and deploy this product and provide mitigation responses.
- Map planning and deployment steps to the four-stage AI product development process.
- Determine how to market the product to capture the pragmatists and conservatives who comprise the largest part of the user market.

Task 1: Review the Product Concept Document

Develop an AI-Enhanced Traffic Management System

Entry	Considerations
Market Problem or Opportunity	• Traffic continues to present challenges for area commuters. • Commuters need a tool that allows them to reduce travel time, determine the best mode of transportation, and receive real-time traffic update notifications. • Product must be easy to access, mobile, and cost-effective.
Market Segments	• Product will support commuters, organizations, and the local municipal government agencies requiring traffic management data. • Product can also be used by the local Department of Transportation (DOT) to identify traffic-related problems and traffic management opportunities and prioritize transportation initiative improvements.
Key Financials	• Product development estimate: \$3.5M • Return on investment: 75%
Market Window	• System is required today. • Goal: Design and develop over a 6-month period.
Competitive Landscape	• Project Green Light is already operational in 12 cities worldwide. The project aims to improve traffic flow, save fuel, and reduce emissions. • Manual traffic reporting systems are available on the web.
Main Features and Functionality	• Analyze traffic conditions on a real-time basis and provide route planning guidance • Load trip history and enable retrieval in seconds • Send immediate notifications when there are sudden changes such as mudslides, accidents, construction, etc. • Recommend best method of transportation to reach a destination to include auto, light rail, and bus

	• Track accidents and recurring issues. Perform root cause analysis and recommend solutions • Perform internal system updates based on new data without human intervention or programming • Enable users to grade their experience and provide feedback to improve system performance • Be capable of interfacing with current DOT infrastructures • Be compatible with current state and federal warning systems • Guard user privacy • Conform to all regulations
Key Differentiators	• App driven. Easy download and compatible with all Apple and Android systems • Optimal personalized route planning • Real-time notification and alert systems • Eco-friendly options • Leverages Intelligent Traffic Systems (ITS) • Dynamic parking solutions • Exceeds "Project Green Light" capabilities • Integrates and enhances existing systems
Go-to-Market Logistics	• Develop initial application (6 months) • Launch marketing campaign • Reach 200,000 Users within 6 months • Integrate real-time data-driven updates daily
Business Success Measurements	• Design and development complete in 6 months • 200,000 users within 6 months • Stay within budget of \$3.5M • ROI of 75% in year one • Customer satisfaction rating of 4.7

Task 2: Download the Product Evaluation Worksheet

Keeping the CTRL key pressed, click to download the [Product Evaluation Worksheet](#) that provides tables to complete this assignment.

Note: Use the COMMAND key instead of CTRL on Mac systems.

Task 3: List key AI skills for successful AI product management

In this task, you will determine at least **five key skills** required by the AI product manager to be successful by:

- Reviewing the reading: AI Product Management Versus Traditional Product Management.
- Referencing the AI Skills Checklist.

Task 4: Identify challenges or risks the team may encounter

In this task, you will explore potential challenges and risks that the team may encounter throughout the AI product lifecycle. Your objective is to identify at least **five challenges or risks** and **outline mitigation responses** for each. To complete this task:

- Review the readings and videos provided in the AI Methods, Challenges, and Opportunities Lesson.

Task 5: Map planning and deployment activities in the AI product deployment process

In this task, you will align planning and deployment activities with the four-step AI product deployment process. Your objective is to effectively plan and launch a new product by mapping at least **three steps to each stage of the deployment process**. To complete this task:

- Review the Video: Stages of AI Product Development.

Task 6: Develop effective marketing strategies for the new AI product

In this task, you will strategize on how to effectively market the new AI product, particularly targeting pragmatists and conservatives. Your objective is to share at least **three strategies** aimed at convincing these audiences to use the new service. To complete this task:

- Review the Video: Commercializing AI Products.

Task 7: Compare your analysis to the solution

Keeping the CTRL key pressed, click to download the [Product Concept Potential Solution](#) document.

Note: Use the COMMAND key instead of CTRL on Mac systems.

- Review the solution and amend your solution as desired.
- You may identify factors that are not in the solution and that is fine.

- This solution addresses and provides a potential list of considerations that apply to both the product scenario and any potential AI product concept you may manage.
